Project Title: Challenges of Monitoring Academic Performance in Nigerian Primary Schools

Methodology

The project will adopt a Python-based data analysis approach to examine and monitor the academic performance of Primary 4, Primary 5, and Primary 6 pupils in a selected primary school in Ibadan, Oyo State. The methodology will involve the following seven steps:

1. **Data Collection:** Obtain the available academic performance dataset containing pupils' results from Primary 4, Primary 5, and Primary 6.
2. **Data Cleaning:** Identify and correct missing values, duplicate records, inconsistent entries, and formatting errors to improve data quality.
3. **Data Organisation:** Structure the dataset according to class levels, subjects, and academic scores to support effective analysis.
4. **Performance Analysis:** Use Python to calculate total scores, average scores, and subject performance for pupils across the three class levels.
5. **Identification of Academic Challenges:** Apply defined performance thresholds to identify pupils with low scores and subjects where additional academic support may be required.
6. **Data Visualization:** Generate charts and graphs using Python libraries such as Matplotlib and Seaborn to illustrate performance patterns and comparisons across subjects and classes.
7. **Reporting and Recommendations:** Present the findings in a structured report, highlighting key performance challenges and recommending areas where teachers can provide targeted academic support.
8. **Conclusion**

The exposed project seeks to address Challenges in Monitoring pupils academic performance in Nigerian Primary Schools through a practical Python-based solution. By combining data preparation, analysis, and Visualization, the system will demonstrate how Education data can be used to track learning progress and support evidence-based decision-making.
